

Portable floor scale in bumper guard frame

for stationary and portable use

Floor scales 'made by RHEWA' are robust steel constructions with precise load cells, designed for daily use in logistics and production. The scales can be delivered with manufacturer's conformity assessment and used for legal-for-trade applications.

Key factors for selecting a suitable floor scale include the required weighing surface, maximum load capacity, and the lifting and transport equipment intended for loading. Additionally, consideration should be given to the space available at the installation site and the layout of traffic routes.

Floor scale with ramp access and lateral bumper guard

Drive-through scale with integrated ramp

U-shaped scale with entry protection frame

Protective frame, designed for clearance

If the floor scale is primarily loaded using a forklift or high-lift truck, a frame in which the scale is embedded provides optimal protection against overload and damage from side impacts.

A floor scale in an elevated protective frame can be accessed from all sides by lifting equipment with forks. Loading via forklift is possible without restriction.

Mobility and operational safety

For transporting the scale with a forklift or lifting equipment, the protective frame can be equipped with entry pockets. When using the scale for legal-for-trade applications, the frame can be aligned at the installation site using 4 adjustable feet. A fixed or foldable tripod increases compact mobility without additional assembly effort.

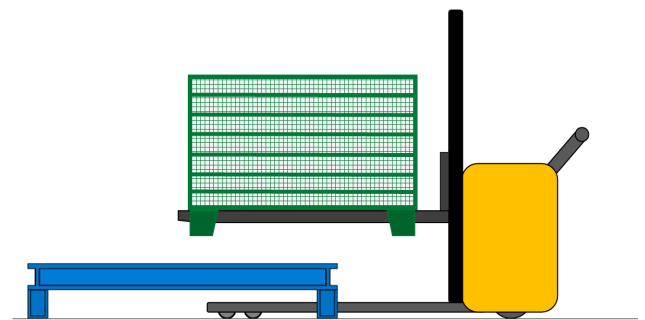

Options

The power supply of the portable floor scale can be provided via a 230V mains cable or an integrated or separately attached rechargeable battery. For network integration, the WLAN interface is available. Loading states, setpoints, or limit values can be clearly displayed using the signal tower. With a wireless remote control, the scale can also be operated from a forklift, for example.
